Tools for accounting data recording

Coges payment systems make it possible for the operator to get all the data necessary to maintain quickly and accurately correct accounting of the vending machine.

The accessories for the accounting data recording allow to download data and import it on a management software in the most efficient and easy way for the user.

BTDataKey

BTDataKey records the accounting data from a payment system and send it to a smartphone or PDA via Bluetooth connection. The data collection is done by inserting the key into a standard Coges reader or directly from a cashless system or coin mech equipped with an infrared port for data collection.

BTDataKey is accompanied by an app for smartphones which receives the accounting data, encrypts it and transmits it to a management software or a database.

IR Data-Key

The IR Data-Key permits the data recording by using any palmtop terminal equipped with IR port and a special communication software, according to the EVA-DTS protocol. The operation can be carried out in all Coges contactless systems.

When the Key is inserted in the reader, it downloads the data from the System and transmits it via IR to any palmtop terminal.

IR PORT Module

The IR PORT Module permits to record the accounting data by means of a palm-top computer. It consists of an interface installed inside the vending machine. The data are communicated to the palm-top computer via IrDA in EVA-DTS format.
